The ADaM Use Case for SubClass

Monika Kawohl

Background

- ADaM defines 3 Standard Data Structures

ADaM Standard Data Structures	Identified in Define-XML via a Class value of ...
ADSL	SUBJECT LEVEL ANALYSIS DATASET
BDS	BASIC DATA STRUCTURE
OCCDS	OCCURRENCE DATA STRUCTURE

- Other analysis datasets which adhere to the ADaM fundamental principles and naming conventions, but are not ADSL, BDS or OCCDS, are specified as Class="ADAM OTHER"
- For a given study analysis, there are typically multiple ADaM datasets of Class BDS or OCCDS
- ADaM does not define standard dataset names (exception: ADSL)

Use Cases

- There is currently no way to identify specific applications of these classes, e.g.,
 - BDS dataset for time-to-event (TTE) analysis
 - OCCDS dataset for adverse event analysis

Sample TTE dataset

STUDYID	USUBJID	PARAMCD	PARAM	AVAL	ADT	STARTDT	CNSR	EVNTDESC	...
ABC	ABC_101	TTDEATH	Time to Death (days)	15	15JAN2018	01JAN2018	0	Death	

Subclasses adhere to the definition of the "Parent" Class but have additional requirements and rules to be considered.

Sample adverse event analysis dataset

STUDYID	USUBJID	AESQ	AEDECOD	AEBODSYS	ASTDT	AENDT	AESR	...
ABC	ABC-102	5	Headache	Nervous system	02JAN2018	03JAN2018	Y	

➤ **Subclasses facilitate validation**

Usage of SubClass

- Note: There is no requirement that a SubClass is defined for every ADaM dataset.
- SubClass is considered metadata → need a standard place for it in Define-XML
- Controlled Terminology CT(s) for valid values
 - Dependent on "parent" Class
 - Collaboration between ADaM team and Define-XML team
 - CTs may grow over time
 - ADaM documents in the pipeline may have use cases for SubClass, too.
- Work in progress
 - ADaM Define-XML v2.1 example including SubClass
 - Definition of SubClass in a suitable ADaM document

CTs Requested Regarding SubClass

New Codelist Name: SCLBDS (this CT should be non-extensible and should be added to the new Define-XML CT to be created)
New Codelist Description: Subclass of Standard Data Structure/General Observation Class BASIC DATA STRUCTURE

CDISC Submission Value	CDISC Synonym(s)	CDISC Definition	Reason for this request and how it will be used
TIME-TO-EVENT	Time-to-Event, TTE	A specific application of the ADaM BASIC DATA STRUCTURE (BDS) for Time-to-Event ADaM datasets. The value of "TIME-TO-EVENT" can only be used in the context of time-to-event ADaM datasets of Class "BASIC DATA STRUCTURE".	The introduction of this subclass will facilitate identification of Time-to-Event datasets generated according to the document "CDISC ADaM Basic Data Structure for Time-to-Event Analysis" via metadata (define.xml). Identification of this subclass of a BASIC DATA STRUCTURE will enable specification of validations rules specific to this subclass.

New Codelist Name: SCLOCCDS (this CT should be non-extensible and should be added to the new Define-XML CT to be created)
New Codelist Description: Subclass of Standard Data Structure/General Observation Class OCCURRENCE DATA STRUCTURE

CDISC Submission Value	CDISC Synonym(s)	CDISC Definition	Reason for this request and how it will be used
ADVERSE EVENTS	Adverse Events	A specific application of the ADaM OCCURRENCE DATA STRUCTURE (OCCDS) for ADaM adverse events datasets. The value of "ADVERSE EVENTS" can only be used in the context of ADaM datasets of Class "OCCURRENCE DATA STRUCTURE".	The introduction of this subclass will facilitate identification of ADaM adverse events datasets generated according to the document "CDISC ADaM Structure for Occurrence Data (OCCDS)" via metadata (define.xml). Identification of this subclass of an OCCURRENCE DATA STRUCTURE will enable specification of validations rules specific to this subclass.

SDTM Origin – Type and Source Combinations

Type	Source				Notes
	Subject	Investigator	Vendor	Sponsor	
Collected	ePro	CRF	Lab data, ECG	X	This term should be used for clinical data that were actually observed or recorded by a person or received from an instrument; it should not be used for data that have been interpreted, calculated, or derived from other information.
Derived	X	X	Lab data, ECG	SDTM	Derivation examples include calculations performed during data collection (e.g., --DY). Other derivation examples: calculations within ePRO (e.g., questionnaire section scores) and calculations within EDC (e.g., BMI, BSA).
Assigned	X	X	Adjudicator	SDTM	Examples of this include third-party attributions by an adjudicator, coded terms that are supplied as part of a coding process, and values that are set independently of any subject-related data values in order to complete SDTM fields such as DOMAIN and --TESTCD
Protocol	X	X	X	SDTM	An example would be VSPOS (Vital Signs Position), which could be specified in the protocol and be provided by other means (e.g. CRF, eDT).
Predecessor	X	X	X	X	Use when a value is an exact copy of another value in an SDTM dataset.
