Study Data Validation Rules

Study data validation helps to ensure that the study data are compliant, useful, and will support meaningful review and analysis

SDTM Implementation Guide v3.2/SDTM v1.4

4.1.1.5 CDISC Core Variables

The concept of core variable is used both as a measure of compliance, and to provide general guidance to sponsors. Three categories of variables are specified in the “Core” column in the domain models:

- A **Required** variable is any variable that is basic to the identification of a data record (i.e., essential key variables and a topic variable) or is necessary to make the record meaningful. **Required variables must always be included in the dataset and cannot be null for any record.**

SDTMIG Conformance Rules (including a user guide)

FDA Study Data Technical Conformance Guide

Whenever --DTC, --STDTC or --ENDTC, which have the role of timing variables, are included in a general observation class domain, the matching Study Day variables (--DY, --STDY, or --ENDY, respectively) should be included. For example, in most Findings domains, --DTC is Expected, which means that --DY should also be included. In the SDTM Subject Visits domain, SVSTDTC is Required and SVENDTC is Expected; therefore, both SVSTDY and SVENDY should be included.

- Difficulties to validate the rules:
 - Some of the rules are not clear
 - You can't see how the rules were implemented in the software

Conclusion

- Validation of the New rules in Pinnacle 3.0
- Development of the non-conformant rules to validate the database and insert the issues reports in the csdrg
- Question: Difference between rules in Pinnacle 21 Community and in Pinnacle 21 Enterprise?
